No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

B40973

Spermatid-specific protein T2 precursor - common cuttlefish

Spermatid-specific protein T2 precursor - common cuttlefish

N.Alternate names: arginine-rich proteanine; testis-specific protein T2

N.Alternate names: arginine-rich proteanine; testis-specific protein T2

C.Species: Sepia officinalis (common cuttlefish)

C.Species: Sepia officinalis (common cuttlefish)

C.Date: 21-Apr-1992 #sequence_revision 21-Apr-1992 #text_change 13-Sep-1998

C.Accession: B40973; S14086

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 7
A60234
IGA For receptor precursor - Streptococcus agalactiae (strain SB35)
Nicontains: beta antigen
Nicontains: beta antigen
C: Species: Streptococcus agalactiae
R: Heden, L.O.; Frithz, E.; Lindahl, G.
A: Residues: 1-1134 < HED>

ATP-binding protein PhnP (phnP) homolog - Archaeoglobus fulgidus

ATP-binding protein PhnP (phnP) homolog - Archaeoglobus fulgidus

C; Species: Archaeoglobus fulgidus

C; Date: 05-Dec-1997 #sequence_revision 05-Dec-1997 #text_change 22-Oct-1999

C; Accession: F63309

C; Accession: F63309

H+-transporting ATP synthase (EC 3.6.1.34) protein 6 - Allomyces macrogynus mitochondric
C; Species: mitochondrion Allomyces macrogynus
C; Date: 19-War-1997 #sequence_revision 09-May-1997 #text_change 22-Jun-1999
C; Accession: S63648
R; Paquin, B.; Lang, B.F.
J. Mol. 1810. 1255, 688-701, 1996
A; Title: The mitochondrial DNA of Allomyces macrogynus: the complete genomic sequence fr
A; Reference number: S63638
A; Reference number: S63635, MUID:96226032
A; Molecule type: DNA
A; Residues: 1-262 < PAQ>
A; Residues: 1-262 < PAQ>
A; Residues: 1-262 < PAQ>
A; Rossidues: 1-262 < PAQ
A; Rossidues: 1-262
N;Alternate names: sperm protamin SP
C;Species: Loligo pealeii (longfin squid)
C;Date: 27-Oct-1995 #sequence_revision 03-Nov-1995 #text_change 07-May-1999
C;Accession: S56117
R;Wouters-Tyrou, D.; Martin-Ponthieu, A.; Ledoux-Andula, N.; Kouach, M.; Jaquinod, M.; S
Bucchem. J. 309, S29-334, 1995

                                                                                                                                                                                                                                                                                                                                                                                            Krajewski C., Young J., Buckley L., Woolley P.A., Westerman M.;
"Reconstructing the taxonomic radiation of dasyurine marsupials with
cytochrome b, 12S rRNA, and protamine P1 gene trees.";
J. Mammal. Evol. 4:217-236(1997).
-I- FUNCTION: PROTAMINES SUBSTITUTES FOR HISTONES IN THE CHROMATIN OF
SPERM DURING THE HAPLOID PHASE OF SPERMATOGENESIS. THEY COMPACT
SPERM DIATO A HIGHLY CONDENSED, STABLE AND INACTIVE COMPLEX.
-I- SUBCELLULAR LOCATION: HUCLEAR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

containing at least 5, protegrin, and are mining and are mining at least 7 consecutive as from (a). Containing a side chain that includes a basic group; be Trp; each B is an acontaining a side chain that includes a basic group; and each X is an aliphatic or aromatic as. The linear peptide may be and each X is an aliphatic or aromatic as. The linear peptide may be critically at least 7 consecutive as from (a)-(c). Containing at least 5, preferably at least 7 consecutive as from (a)-(c). Containing at least 5, preferably at least 7 consecutive as from (a)-(c). Containing at least 5, preferably at least 7 consecutive as from (a)-(c). Containing at least 5, preferably at least 7 consecutive as from (a)-(c). Containing at least 5, preferably at least 7 consecutive as from (a)-(c). Containing at least 5, preferably at least 7 consecutive as from (a)-(c). Containing at least 7 consecutive as from (a)-(c). Containing perfects and are termed peptide antibiotics. They fall into 3 main containing bends due to the presence of with no major structure but containing bends due to the presence of with no major structure but containing bends due to the presence of with no major structure but containing bends due to the presence of the innear peptide antibiotic categories defined above: (a)-peptides of the innear peptide designed on peptides able to cross to protegrins; and (c)-peptides are based on tachyplesins. This sequence contragrines and is conjugated to a doxorubicin molecule by a succinate the BBB and is conjugated to a doxorubicin molecule by a succinate the BBB and allowed linker. The peptide may also be linked to a benzylpenicillin molecule of contingates of the linear peptide the peptide may also be linked to a benzylpenicillin molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; neurodegenerative; antidepressant; analgesic; antimicrobial; blood-brain barrier; diagnostic; central nervous system; protegrin; Antennapedia; tachyplesin; peptide antibiotic; Alzheimer's disease; cancer; Parkinson's disease; depression; pain; meningitis; dalargin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the use of linear peptides, coupled to an active agent, to prepare a composition able the cross the blood-brain barrier for diagnosis or treatment of disorders localised in the central nervous system. The linear peptide preferably has the formula: (a) X1- X16;
                                                                                      This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonuclectides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; neurodegenerative; antidepressant; analgesic; antimicrobial; blood-brain barrier; diagnostic; central nervous system; protegrin; Antennapedia; tachyplesin; peptide antibiotic; Alzheimer's disease; cancer; Parkinson's disease; depression; pain; meningitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics for the peptide antibiotisc family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the
                                                                                                                                                     comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, particularly that cause cancer cells to become resistant to the agent, particularly produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antibody; ribozyme; antitumour agent; antiviral; mammal; cell membrane; passive transport; cytoplasm;

                                                                                                                                                                                                                                                                                                                                                                                                                                           ;
disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonuclectides, ribozymes, antitumour agents, and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, marticularly produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New composition useful for cancer treatment and prevention, contains anticancer agent and peptide vector that transports agent into cells

The present sequence is a specifically claimed example of a peptide, crecombinantly produced, corresponding to the generic formula: recombinantly produced, corresponding to the generic formula: an abasic amino acid; A2 and A3 = a small amino acid; A4 = a where A1 = a basic amino acid; A2 and A3 = a small amino acid; A1 and A16 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar, a basic, hydrophobic or small amino acid; and A18 may be absent or a basic, hydrophobic or small amino acid; and A18 may be absent or a basic, conternial products and its N-terminal acylated and/or C-terminal amidated or estarlied forms, all of which may contain a disulphide bond to give a cystine residues are replaced by a hydrophobic, small or the cystine residues are replaced by a hydrophobic, small or the content of anti-fungal agents in plants and are useful as anti-bacterial, anti-viral and designated protegrins and are useful as anti-bacterial, anti-viral and continuous and are virus or microbial or viral infection in plants by preventing the residues are replaced disease caused by microorganisms e.g. treatment of sexually transmitted disease caused by microorganisms of candida albicans, HIV-1, Chlamydia trachomatis, Treponema pallidum and septivatives for food. The protegrins are more effective under a spreservatives for food. The protegrins are more effective under a spreservatives for food. The protegrins are more effective under a persibility products and are non-toxic to the cells of serum) than certain
                                                                                                                                                          Antibacterial; antiviral; antifungal; antibiotic; endotoxin; Candida albicans; gram-negative bacteria; STD; sexually transmitted disease; HIV-1; Chlamydia trachomatis; Treponema pallidum; Neisseria gonorrhoeae; eye care; preservative;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cationic, antimicrobial, virus-neutralising protegrin peptide(s) useful for the treatment of microbial infection, as food preservatives and in eye care solutions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention, and comprises 10.30 amino acid residues based on a naturally-occurring protegrin peptide. The antimicrobial peptide is useful in environmental composition for application to plants or plant environments, for inhibiting the growth of microbes. The peptide is useful for treating or preventing microbial infections, e.g. caused by Staphylococcus aureus, Pseudomonas, Helicobacter pylori or an antibiotic-resistant bacterium, or related diseases. The peptide can be used to inactivate the endotoxin of Gram-negative bacteria. The peptides can be used in disinfectant compositions, and as preservatives for anaterials such as foodstuffs, cosmetics, medicaments or other materials containing nutrients for organisms. The peptides exhibit decreased haemolytic activity against human red blood cells as compared with native for and melittin. They have improved serum compatibility and therefore improved uses as systemic antibiotics. At the same time the peptides
                                                                                                                                                                                                                                                                                                                 Antimicrobial peptide: protegrin: microbe growth inhibitor; Pseudomonas; microbial infection; Staphylococcus aureus; Helicobacter pylori; therapy; antibiotic-resistant bacterium; disinfectant composition; preservative; haemolytic activity; systemic antibiotic.

materials such as foodstuffs, cosmetics, medicaments or other materials containing nutrients for organisms. The peptides exhibit decreased haemolytic activity against human red blood cells as compared with native PG-1 and melittin. They have improved serum compatibility and therefore improved use as systemic antibiotics. At the same time the peptides provide broad spectrum activity with a low frequency of resistance.
                                                                                                                                                                    Antimicrobial peptide; protegrin; microbe growth inhibitor; Pseudomonas; microbial infection; Staphylococcus aureus; Helicobacter pylori; therapy; antibiotic-resistant bacterium; disinfectant composition; preservative; haemclytic activity; systemic antibiotic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents an example of an antimicrobial peptide (I) of the invention, and comprises 10-30 amino acid residues based on a naturally-occurring proceptin peptide. The antimicrobial peptide is useful in environmental composition application to plant environmental composition to application to plant environments, for inhibiting the growth of microbes. The peptide is useful for treating or preventing microbial infections, e.g. caused by staphylococcus aureus, Pseudomonas, Helicobacter pylori or an antiblotic-resistant bacterium, or related diseases. The peptide can be used to inactivate the endotoxin of Gram-negative bacteria. The peptides can be used in disinfectant compositions, and as preservatives for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   72.5%; Score 66; DB 20; Length 18; 72.2%; Pred.                                                                                                                                                                  food.
The present sequence is an antimicrobial protegrin peptide, which has a broad spectrum of activity against microbial targets, including gram-positive and gram-negative bacteria, yeast, fungi, protozoa and certain strains of viruses and retroviruses, e.g. HIV. It can be used to preserve or disinfect a variety of materials, including medical equipment, foodstuffs, cosmetics, contact lens solutions, medicaments or other nutrient containing materials. It can also be used for the prophylaxis or treatment of microbial infections or diseases in plants and animals, e.g. conjunctivitis, keratitis, corneal ulcers, stomach ulcers associated with Helicobacter pylori, sexually transmitted diseases, gram-negative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sepsis, endocarditis, pneumonia and other respiratory infections, urinary tract infections, systemic candidiasis and oral mucositis. It is biostatic or biocidal against clinically relevant pathogens exhibiting multi-drug resistance, e.g. vancomycin resistant Enterococcus faacium or faecalis, penicillin resistant streptococcus pneumoniae and methicillin resistant Staphylococcus aureus (MSGA). It is given at a dosage of 0.1 to 5, preferably 0.5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antimicrobial protegrin peptide(s) - having activity against bacteria, yeast, fungi, protozoa and certain strains of viruses (e.g. HIV)

```
The present sequence is a specifically claimed example of a peptide, recombinantly produced, corresponding to the generic formula:

A1-A2-A3-A4-A5-Cys-A7-Cys-A9-A10-A11-A12-Cys-A14-Cys-A16-(A17-A18)

CC A1-A3-A4-A5-Cys-A7-Cys-A9-A10-A11-A12-Cys-A14-Cys-A16-(A17-A18)

CC A1 = a basic amino acid; A2 and A3 = a small amino acid; A3. A12 and A16 = a hyprophobic amino acid; A17 and A14 = a hydrophobic amino acid; A18 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; hydrophobic or small amino acid; neutral/polar, hydrophobic or small amino acid; This has a charge of a centrified forms, all of which may contain a disulphide bond to give a esterified forms, all of which may contain a disulphide bond to give a cesterified forms, all of which may contain a disulphide bond to give a cesterified forms, all of which may contain a disulphide bond to give a cesterified forms, all of which may contain a disulphide bond to give a cesterified forms, all of which may contain a disulphide bond to give a cesterified forms, all of which may contain a disulphide bond to give a cesterified forms, all of which may contain a disulphide bond to give a cesterified in a minals. The protegrins confer resistance to microbe viral infection in plants by preventing the growth of a virus or microbe are particularly useful for the treatment of sexually transmitted are particularly useful for the treatment of sexually transmitted are particularly rependent pallidum and Neisserial gonorrhoese. They can also the used in each are particularly mand Neisserial gonorrhoese. They can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          be used in eye care solutions and as preservatives for food. The protegrins are more effective under physiological conditions (e.g. in the presence of serum) than certain antibiotics and are non-toxic to the cells of higher organisms.
                                                                                                                                                                                                          Cationic, antimicrobial, virus-neutralising protegrin peptide(s) useful for the treatment of microbial infection, as food preservatives and in eye care solutions

Peptides of this formula are designated protegrins and are useful as anti-bacterial, anti-viral and anti-fungal agents in plants and animals. The protegrins confer resistance to microbial or viral infection in plants by preventing the growth of a virus or microbe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a specifically claimed example of a peptide, recombinantly produced, corresponding to the generic formula:

Al-A2-A3-A4-A5-A4-A7-Cys-A3-A10-A11-A12-Cys-A14-Cys-A16-(A17-A18)

Where Al = a basic amino acid; A2 and A3 = a small amino acid; A4 = a basic or small amino acid; A5, A7 and A14 = a hydrophobic amino acid; A9, A12 and A16 = a basic, hydrophobic, neutral/polar or small amino acid or proline; A17 may be absent or a basic, neutral/polar or small amino acid or proline; A17 may be absent or a basic, neutral/polar, hydrophobic or small amino acid and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; This has a charge of at

and inactivate the endotoxin of gram-negative bacteria. The protegrins are particularly useful for the treatment of sexually transmitted disease caused by microorganisms e.g. candida albicans, HIV-1, Chlamydia trachomatis, Treponema pallidum and Neisseria gonorrhoeae. They can also be used in eye care solutions and as preservatives for food. The protegrins are more effective under physiological conditions (e.g. in the presence of serum) than certain antibiotics and are non-toxic to the cells of higher organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                recombinantly produced, corresponding to the generic formula:

A1-A2-A3-A4-A5-Cys-A7-Cys-A9-A10-A11-A12-Cys-A14-Cys-A16-(A17-A18)

A1-A2-A3-A4-A5-Cys-A7-Cys-A9-A10-A11-A12-Cys-A14-Cys-A16-(A17-A18)

A1-A2-A3-A4-A5-Cys-A7-Cys-A9-A10-A11-A12-Cys-A14-Cys-A16-(A17-A18)

Basic cr small amino acid; A5, A7 and A1 = a hydrophobic amino acid; A1 and A16 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A18 may be absort or a basic, hydrophobic or small amino acid; and A18 may be absort or a basic, neutral/polar, hydrophobic or small amino acid; A14s has a charge of at least +3 and its N-terminal acidited and adisulphide bond to give a cysteine bridge. This peptide is in snake form where all the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a specifically claimed example of a peptide, recombinantly produced, corresponding to the generic formula: A1-A2-A3-A4-A5-Cyg-A7-Cyg-A9-A10-A11-A12-Cyg-A14-Cyg-A16-(A17-A18) where A1 = a basic amino acid; A2 and A3 = a small amino acid; A4 = a basic amino acid; A5 A and A14 = a hydrophobic amino acid; A9, A12 and A16 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid or proline; A17 may be absent or a basic, neutral/polar,
cystine residues are replaced by a hydrophobic, small or large polar amino acid (e.g. alanine in this case). Peptides of this formula are designated protegrins and are useful as anti-bacterial, anti-viral and anti-fungal agents in plants and animals. The protegrins confer resistance to microbial or viral infection in plants by preventing the growth of a virus or microbe and inactivate the endotroxin of graminegative bacteria. The protegrins are particularly useful for the treatment of sexually transmitted disease caused by microorganisms e.g. Candida albicans, HIV-1, Chlamydia trachomatis, Treponema pallidum and Neisseria gonorrhoeae. They can also be used in eye care solutions and as preservatives for food. The protegrins are more effective under physiological conditions (e.g. in the presence of serum) than certain antibiotics and are non-toxic to the cells of higher organisms.
                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antibacterial; antiviral; antifungal; antibiotic; endotoxin; Candida albicans; gram-negative bacteria; STD; sexually transmitted disease; HIV-1; Chlamydia trachomatis; Treponema pallidum; Neisseria gonorrhoeae; eye care; preservative;

hydrophobic or small amino acid; and Al8 may be absent or a basic, neutral/polar, hydrophobic or small amino acid. This has a charge of at least +3 and its N-terminal acylated and/or C-terminal amidated or esterified forms, all of which may contain a disulphide bond to give a cysterine bridge. This peptide is in snake form where all the cystine residues are replaced by a hydrophobic, small or large polar amino acid (e.g. alanine in this case). Peptides of this formula are designated protegrins and are useful as anti-bacterial, anti-viral and anti-fungal agents in plants and an anti-bacterial, anti-viral and resistance to microbial or viral infection in plants by preventing the growth of a virus or microbe and inactivate the endotoxin of gram-
                                                                                                                                                                                  negative bacteria. The protegilns are particularly useful for the treatment of sexually transmitted disease caused by microorganisms e.g. Candida albicans, HIV-1, Chlamydia trachomatis, Trepromem pallidum and Neisseria gonorrhoeae. They can also be used in eye care solutions and as preservatives for food. The protegrins are more effective under physiological conditions (e.g. in the presence of serum) than certain antibiotics and are non-toxic to the cells of higher organisms.
                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antibacterial; antiviral; antifungal; antiblotuc; endocoxin; Candida albicans; gram-negative bacteria; STD; sexually transmitted disease; HIV-1; Chlamydia trachomatis; treponema pallidum; Neisseria gonorrhoeae; eye care; preservative;

The present sequence is a specifically claimed example of a peptide, recombinantly produced, corresponding to the generic formula:

A1-A3-A4-A4-A5-Cys-A7-Cys-A9-A10-A11-A12-Cys-A14-Cys-A16-A17-A18)

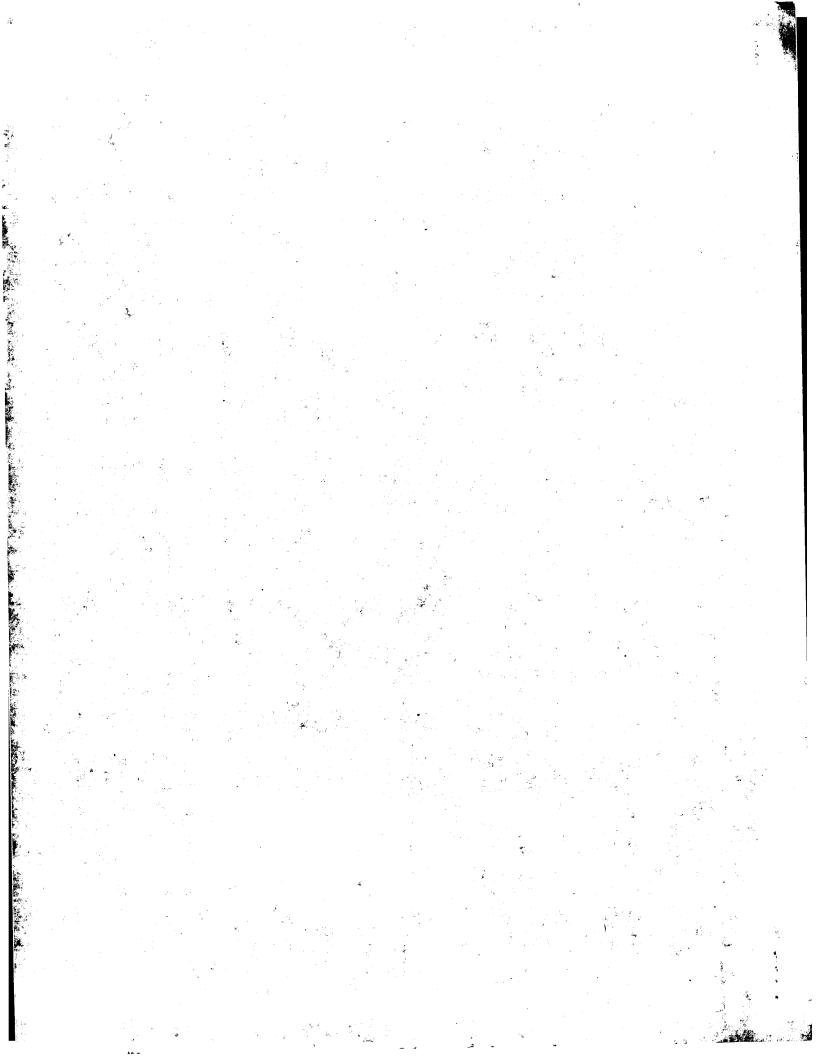

where A1 = a basic amino acid; A2 and A3 = a small amino acid; A9, A12 and A16 = a basic, hydrophobic, neutral/polar or small amino acid; A9, A12 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar, hydrophobic or small amino acid; and A18 may be absent or a basic, hydrophobic or small amino acid; and A18 may be absent or a basic, hydrophobic or small amino acid; This has a charge of at least +3 and its N-terminal acylated and/or C-terminal amidated or esterified forms, all of which may contain a disulphide bond to give a cysteine bridge. Peptides of this formula are designated protegrins and create state and animals. The protegrins confer resistance to microbel or viral infection in plants by preventing the growth of a virus or microbe and inactivate the endotoxin of gram-negative bacteria. The protegrins are particularly useful for the treatment of sexually transmitted disease caused by microorganisms e.g. Candida albicans, HIV-1, Chlamydia transmins are more effective under physiological conditions (e.g. in the presence of serum) than certain antibiotics and are non-toxic to the
useful for the treatment of microbial infection, as food preservatives and in eye care solutions
